

ABSTRACT OF THE DISCLOSURE

A handsaw includes a handle, a blade mounted on the handle, and a light emitting member mounted on the handle to produce a longitudinal light source aligning with a lower edge of the blade. Thus, the sawing line of the workpiece and the longitudinal light source of the light emitting member are directed in the same direction, so that a worker can drive the blade to move in the common direction indicated by the sawing line of the workpiece and the longitudinal light source of the light emitting member to cut the workpiece exactly, thereby facilitating the worker sawing the workpiece, and thereby greatly enhancing precision of sawing the workpiece.
